

BUCKHORN™

Invert-Emulsion Oil Based Drift Management/Deposition Agent

- Buckhorn improves spray penetration into the plant canopy and minimizes drift by providing uniform spray droplets, most of which are not in the “fine” spray droplet range.
 - Buckhorn does not create large spray droplets that can sometimes bounce off and miss the target species.
- Buckhorn increases the density of the spray droplets and improves the cohesion of the spray droplet.
 - These traits increase the speed of the droplet and hold the droplets together to prevent “shearing” that causes smaller droplets.
 - Minimizes off-target movement and improves deposition within the plant canopy.
- Typical use rate is 4 oz/A
 - Rate range can vary from 2-6 oz/A
 - See label for more specific rate recommendations
- Package Sizes:
 - 2x2.5 gallon case
 - 275 gallon
